

Spare parts order form

Change of inner cylinder from 4001 to 18001.

Assembly Notice

To enable users to change from our old lock 4001 to our currently employed lock 18001, we offer replacement packs at attractive conditions. The inner cylinder 4001 is removed from the lock using the enclosed dismounting key. After this, the new inner cylinder 18001 is inserted in the open state with the key inserted in it without the need for any tools.

The advantage of the 18000 locking system is that there is an overarching master and dismounting key for all locks. With the 4000 locking circuit, on the other hand, there is only one locking-dependent disassembly key and no master key. Furthermore, the 4000 locking system is no longer installed in our units and is only available as a spare part.

You can order our master and dismounting keys for the 18000 locking system on a separate order form.

For your own security, only the management of your institution is authorised to order a replacement pack, e.g. the school administration or company management. These persons will then pass on the keys internally at their own discretion.

The delivery will then be made separately to the person who ordered it. Shipment is insured and undertaken by our parcel service provider.

Note on the key number

You will find the key number on the inner cylinder or on the key. Please also see the adhesive label on your model which specifies the order (AB) and model number as well as the week of delivery (LW).

Ordering procedure

Please complete the order form on page 2, sign the document and return it to us. Enter the number of replacement packs on the left next to the price.
